Labor

2023-05-04

Neste trabalho analiso os dados de http://archive.ics.uci.edu/ml/datasets/Labor+Relations?ref=datanews.io e o artigo mencionado para o projeto está em http://ebot.gmu.edu/handle/1920/1622.

O projeto original, conforme a descrição do mesmo, teve como propósito "Software de aprendizagem de conceitos testando um método experimental para aprender descrições de conceitos em duas camadas. Os dados foram utilizados para aprender a descrição de um contrato aceitável e não aceitável. Os contratos não aceitáveis foram obtidos por meio de entrevistas com especialistas ou por meio de criação de exemplos similares, mas que não atendiam aos requisitos do contrato aceitável."

As descrições dos atributos são:

Nome	Tipo	Descrição
duration	numeric	duração do acordo
wage-increase-first-year	numeric	aumento salarial no primeiro ano do contrato
wage-increase-second-year	numeric	aumento salarial no segundo ano do contrato
wage-increase-third-year	numeric	aumento salarial no terceiro ano do contrato
cost-of-living-adjustment	{'none','tcf','tc'}	ajuda de custo de vida
working-hours	numeric	número de horas de trabalho durante a semana
pension	{'none','ret_allw', 'empl_contr'}	contribuições do empregador para o plano de pensão
standby-pay	numeric	pagamento de disponibilidade
shift-differential	numeric	diferencial de turno: suplemento para trabalho no II e III turno
education-allowance	{'yes','no'}	ajuda de custo para educação
statutory-holidays	numeric	número de feriados legais
vacation	{'below_average','average', 'generous'}	número de dias de férias remuneradas
longterm-disability-assistance	{'yes','no'}	ajuda do empregador durante a incapacidade de longo prazo do empregado
contribution-to-dental-plan	{'none','half','full'}	contribuição do empregador para o plano odontológico
bereavement-assistance	{'yes','no'}	contribuição financeira do empregador para cobrir os custos de luto
contribution-to-health-plan	{'none','half','full'}	contribuição do empregador para o plano de saúde
class	{'bad','good'}

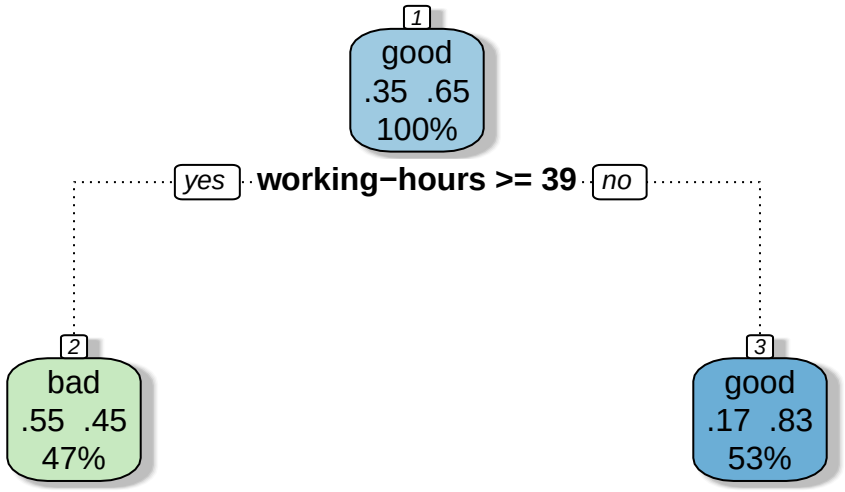
## 42                 12      generous   bad
## 52                 11 below_average  good
## 53                 13      generous  good
## 57                  9      generous  good
```

Modelo e plot da Árvore

```
labor_tree <- rpart(class~., data=train.set, method = "class", control=rpart.control(minsplit=20, minbu

fancyRpartPlot(labor_tree, caption = NULL)
```



Predições

```
predictions <- predict(labor_tree,test.set)

predictions
```

```
##         bad     good
## 1  0.550000 0.450000
## 2  0.173913 0.826087
## 3  0.173913 0.826087
## 6  0.173913 0.826087
## 13 0.550000 0.450000
## 24 0.550000 0.450000
## 27 0.173913 0.826087
## 32 0.550000 0.450000
## 33 0.173913 0.826087
## 38 0.173913 0.826087
## 42 0.173913 0.826087
## 52 0.173913 0.826087
## 53 0.173913 0.826087
## 57 0.173913 0.826087
```

Como a estrutura de predictions está dessa forma

bad	good
0.550000	0.450000

Eu fiz uma função para colocar em uma lista o nome da coluna com o maior valor. E após uso a função factor para que fique igual a test.set$Age o que me permite usar a confusionMatrix

```
maior_coluna <- function(dados) {
  idx <- max.col(dados)
  nomes <- colnames(dados)
  resultado <- lapply(1:nrow(dados), function(i) nomes[idx[i]])
  return(resultado)
}

predicao <- maior_coluna(data.frame(predictions))

predicao_class <- factor(make.names(predicao))

str(predicao_class)
```

```
##  Factor w/ 2 levels "bad","good": 1 2 2 2 1 1 2 1 2 2 ...
```

```
str(test.set$class)
```

```
##  Factor w/ 2 levels "bad","good": 2 2 2 2 1 2 2 1 1 1 ...
```

Matriz de Confusão

```
cm <- confusionMatrix(predicao_class, test.set$class, mode = "everything")
cm
```

```
